Street, Nanshan District, Shenzhen China

## JZX873 Micro-power wireless Data module

JZX873 data transmission module is highly integrated low-power half-duplex wireless data transmission module, which uses "TI" high-performance RF chips and high-speed microcontroller. Module provides 16 channels, and is equipped with a professional set-up software for the user to change parameters, the module with transparent transmission mode, no user-written set and transmission procedures, you can transmit data of any size. Module size is small, industrial design, the use of voltage is wide, easy to use.

## **Applications:**

- Water, electricity, gas, heating automatic meter reading system
- **\*Wireless smart terminal PDA**
- **\*Wireless Queue System**
- **\*Wireless alarm and security system**
- **XSmart Card**
- Medical and electronic instrumentation automation control
- **XIntelligent teaching equipment**
- Intelligent home automation and lighting control
- **%Wireless electronic scale**

### Features:

- **※Frequency: 430-434MHz**
- **XDistance:3000m(1200Bps)**
- **\*Modulation:GFSK**
- XTransparent transmission
- Built-in watchdog to ensure long-term reliable operation
- **XUART/TTL**、RS232、RS485 Interface
- **X** Convenient and flexible
- **XAlmost 512bytes data buffer**
- **X** Suitable for built-in installation

JZC TELECOM

JZX873 wireless module, the use of ISM frequency band; can be set to 16 communication

channels, transmit power 500mW (27dB), high receiver sensitivity-123dbm, size 63mm \* 43mm \*

15mm (without antenna base), a large number of the billing system, industrial control field use,

very convenient for users to do the embedded wireless systems.

JZX873 the use of transparent transmission, in order to ensure the reliability and stability of the

user's system, plus the transmission check-sum or CRC check-sum error detection mode, the error

data re-transmission. Transceiver module buffer of 512bytes, means that users can be in any state

512bytes of data transfer 1, when the speed is greater than the serial port is set to air rate, is

theoretically unlimited length can send information packets, but does not recommend users to send

long data packets, the proposed length of each packet data between 60 ~ 100B, generally not

longer than the 120B, and recommended user program using the ARQ mode, the error data packets

re-transmission. As follows:

If the actual error rate 10-4, users need to send 1KB about 10000bit information, if the 1KB data

as a packet, sent at least theoretically, there will be a data error in the receiver, then the 1KB data

can never be received correctly. If it is divided into 10 packages, each package 100B, then send 10

packets, the packets according to a probability of only 1 error, the error in the form of a packet

re-transmission by ARQ 1, although it took more than 1 packet and the efficiency decreased by

about 10%, but it can guarantee all the information is correctly received.

JZX873 set parameters, the market is no longer used wireless modules used in the traditional way

to change the parameters of the jumper, causing long-term use because it brings bad, options less

dynamic change is not easy, a lot of inconvenience. JZX873 using the serial port setting parameters

easy and quick, easy set refers to the chip embedded in the user program and operating software in

the background. Meanwhile module

1200/2400/4800/9600/19200/38400bps six kinds of rate and frequency of 16; provide UART /

TTL, RS232, RS485 three kinds of interfaces. Choice for users.

In the work on, JZX873 There are two ways of working, first for the conventional model,

Module is powered On, is in receive mode; you also can be sending data. The second is sleep

TEL: 0755-86714296

mode, that is, through the power module in a dormant state, it must be user-controlled mode Wake-up pin block, the module can send and receive data.

In the application of JZX873 module, the module uses a wide range of voltage, 5V power supply module, the voltage of DC 4.5-5.5V. Users in the use of power to DC power supply, the current must be greater than 500mA, but to choose a good power supply ripple.

#### **Module Pin definition**

#### JZX873 module J1 interfaces seat, nine-pin, defined in detail as follows:

Item	PIN	Description Level	User terminal	Remarks
no		Connected to the		
		terminal		
1	SLE	Sleep control (input) end		Low level to sleep, High level
				awake
2	TXD/RS-485(A)	Serial data transmitting	RXD/RS-485(A)	
		end		
3	RXD/RS-485(B)	Serial data receiving end	TXD/RS-485(B)	
4	GND	Power supply/Ground	DGND/AGND	
5	VCC	+5V	+5V	
6	12	NO. 2 on-off input	user terminal	Customize-and-extend
			on-off output	interface
7	I1	NO. 1 on-off input	user terminal	Customize and
			on-off output	extend interface
8	O2	NO. 2 on-off output	user terminal	Customize and
			on-off input	extend interface
9	O1	NO. 1 on-off output	user terminal	Customize and
			on-off input	extend interface

#### **Dimension**

Note: the IO functions customized from Customer informed.

## Installation

## **Dimension**

## Module with customer equipment connections

Note: JZX873 did not sleep in the state, the module of the SLE feet must be vacant. In the sleep state when the module must be low, the module can send and receive data.

## **Module with PC connections**

Note: As JZX873 mode TTL interface module, so the PC must be added to connect the TTL to RS232 converter, and converter must supply DC 5V of electricity.

## For software testing and change parameters

A, JZX873 module connected to the PC and plug in the power, select the serial port used.

B, the radio detection, when the check to the station (the software will prompt detection success), you can read or change a single parameter.

C, change parameters, when you select a parameter you want to set, after set up to read again, to see the parameters of the module is not what you want.

Note: Two or more modules to communicate, then the frequency of the station modules and air rate must be consistent.

Module to communicate with user equipment, the module's serial port parameters and user settings must be consistent.

JZC TELECOM Technology

**Communicated Module** 

JZX873 wireless module with all the JZX87 series of models to communicate with each

other. Communication as long as you pay attention to the following:

A, select all the modules to the same channel.

B, you have the same communication module of the air rate.

C, the communication module, power supply, interface connection is connected.

Sleep mode module

Hardware wake-up mode, the radio's sleep current of less than 1mA.

Wake-up work in the use of hardware, in the user interface input terminals 1 foot low, the radio

will enter sleep mode, MCU about 1ms of sleep.

When to make the radio into the normal working hours, should be in the user interface, the input

terminal 1 foot high, the radio will enter the normal mode, MCU is working on several ms to

enter into the state, but in order to send data to the stability, the user should be more than 60ms

delay for data transmission.

Note: If the user interface in use 1 foot terminal is not connected, the radio work in normal

working condition.

**Details as followings** 

Module in the working state to sleep state, it is necessary to SLE pin from low to high, if the

module is idle (no transmit / receive data) MCU to sleep within about 1ms; If you are in the

collection and development data, the data will be processed the frame side to sleep.

Module in sleep state to work state, it is necessary to SLE pin from high to low, MCU is working

on several ms to enter into the state, but in order to send data to the stability of the user side should

be more than 60ms latency available for data transmission.

#### Transform on transceiver and receiver

End user devices receiving the data sent by the module, and then transferred to the data center must have sent more than 1ms delay.

## From Module A(transmit) to Module B(receive)

When the user is doing data transfer, the data must take into account the delay module, in order to ensure the reliability of wireless transmission, the company added the module FEC (forward error), and other encoding rules. Then from A to B module module, in the middle of the transmission of data with different baud rates for the delay, in the following table:

Air rate	Time ts1	Air Rate	Time ts1
(bps)	(ms)	(bps)	(ms)
38400	11	4800	43
19200	15	2400	83
9600	25	1200	140

#### **Application of IO control**

JZX873 have 2 on-off input ports, 2 on-off output ports as follows:

#### **IO Attempter Function**

JZX873 have two communication protocols: Full transparence protocol and ID protocol. (Remarks: full transparence protocol is default protocol, if you need JZX873 with ID protocol, please tell us when you order )

#### 1) full transparence protocol

In this mode, whatever protocol you use, JZX873 can send it to the other side, It can not change data format and data bits. JZX873 can be used for Reading meter, RTU and PLC with Address and so on..

#### 2) ID protocol

Shenzhen JZC Telecom technology CO.,LTD,China TEL: +86-755-86714296 http://www.rfmodules.net 5 JZX873 Mini Power Wireless Module User's Manual When your terminal without Address or ID, you can use JZX873 with ID protocol, in this way you can differentiate the data from you terminal. The Main station you must use JZX873 with full transparence protocol, the appurtenant station you must use JZX873 with ID protocol. The JZX873 of the appurtenant station must set ID according JZC RF module soft, you can resolve the data from user terminal transmit according to ID Protocol.

Remarks: when you use JZX873 with ID protocol, we provide 《communication protocol of JZX873 and programmed manual.

#### 3) IO at tempter function

You can use one JZX873 with full transparence protocol for the Main station, some JZX873 with ID protocol for the appurtenant stations, each JZX873 of the appurtenant station must set one unrepeatable ID. You can attempter the appurtenant station IO according to communication protocol of JZX873.

Remarks: when you use IO attempter function, we provide 《communication protocol of JZX873》 and programmer manual.

#### **Description of the normal work light**

Wireless module has a two-color indicator light, power, the red light will flash twice; emission data,

red, green light when receiving data

## JZX873 default parameter

Channel: Five channel; Serial port speed: 9600BPS Serial port verification: Null

Airborne speed: 9600BPS

Channel	Frequency	Channel N.	Frequency
1€	430.2000MHz₽	9₽	458.5250MHz₽
2€	431.4288MHz₽	10₽	459.1250MHz

#### **Technical specification of JZX873**

Technical specification		
Modulation:	GFSK	
Frequency:	433MHz	
Transmit Power:	500mW(27 dB)	
Receiver sensitivity:	-123dBm	
Transmit Current:	<360mA (TTL)	
Receive Current:	<45mA	
Sleep Current:	<1mA	
Channel Rate:	1200/2400/4800/9600/19200/38400Bit/s Customized	
Serial Port Rate:	1200/2400/4800/9600/19200/38400Bit/s Customized	
Interface:	UART/TTL RS232 RS485	
Interface-data-format:	8E1/8N1/8O1	
Working Power:	DC 4.5-5.5V	
Working Temperature:	$-20^{\circ}\text{C} \sim 75^{\circ}\text{C}$ (Customized to $-40^{\circ}\text{C} \sim 85^{\circ}\text{C}$ )	
Working humidity:	10%~90% Relative humidity, non condensing	
Size:	58mm*38mm*10mm	
Communicated Model:	JZX871/JZX873/JZX873/JZX874/JZX875/JZX878	

## **Optional Antenna:**

2.57

## **Trouble and solve ways:**

Trouble and solve ways:				
Troubles	Cause and Remedy			
Between	Communication at both ends of the air rate, parity inconsistency  Frequency inconsistency			
communicate	Without power  Module has destroyed			
Short Distance	The pin of sleep mode not set  Environment very bad or the antenna is blocked  The existence of the same frequency or magnetic or electrical interference, or replacement of the channel away from sources			
	of interference  Power match or not. Voltage and current is large enough			
Module cant	Without power  TTL to RS232 converter is damaged, or without power supply  Converters .module.pc with connection error			
communicate with PC	Change work channels  Serial port baud rate settings are not correct or air, to re-set			
	Power supply ripple big, replace the power supply			

Note: All of the rights of final interpretation and modification by our company
